The antagonist modulates growth of epithelial (and related) cells and can be used diagnostically or therapeutically, eg to treat proliferative diseases of eyes and kidneys, some types of tumours and adrenal vascularisation. It is able to bind with heparin or with the FGF
                                                                                                                                                                               22-APR-1986;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               δÃ
                                 Using plasmid p7B796, E.coli MM294 was transformed, whereby the strain E.coli MM294/pTB796 was obtained, which (IFO 14701, FERM BP-1661) harbors the plasmid pTB796 expressing the mutein represented here. The amino acid sequence Lys 87 to Ser 147 has been deleted. The mutein has high stability and is low in toxicity. It can be used as a healing accelerator for e.g. burns, wounds or postoperative tissues or as a therapeutic drug based on its anglogenic action for e.g. thrombosis or arteriosclerosis. It can also be used as a reagent for acceleration of cell cultivation. A mutein where at least one constituent cysteine is replaced by serine is preferred because the mutein is highly stable and intermolecular bridges and linkages are reduced or eliminated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human basic fibroblast growth factor; human bFGF mutein C86; growth promoting activity; growth stimulating activity; phage M13-PC86; capillary endothelial cells; angiogenic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human basic

The antagonist modulates growth of epithelial (and related) cells and can be used diagnostically or therapeutically, eg to treat proliferative diseases of eyes and kidneys, some types of tumours and adrenal vascularisation. It is able to bind with heparin or with the FGF vascularisation.
                                                                                                                                                                                 22-APR-1986;

                                                     Using plasmid pyB796, E.coli MM294 was transformed, whereby the strain E.coli MM294/pyB796 was obtained, which (IFO 14701, FBRM BP-1661) harbors the plasmid pyB796 expressing the mutein represented here. The amino acid sequence Lys 87 to Ser 147 has been deleted. The mutein has high stability and is low in toxicity. The mutein has high stability and is low in toxicity. It can be used as a healing accelerator for e.g. burns, wounds or postoperative tissues or as a therapeutic drug based on its or postoperative tissues or as a therapeutic drug based on its anglogenic action for e.g. thrombosis or arteriosolerosis. It can also be used as a resgent for acceleration of cell cultivation. A mutein where at least one constituent cysteine is replaced by serine is preferred because the mutein is highly stable and intermolecular bridges
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         basic fibroblast growth factor. It has high fibroblast growth promoting, vascendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing of, eg burns, wounds and postoperative tissues, as a drug for thrombosis or arteriosclerosis, or as a reagent to accelerate cell cultivation. Cys 70 and Cys 88 may be replaced by Ser, ans Ile 138 is replaced by Ser.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                rhbrGF mutein C137 (encoded by N90407) lacks 9 C-terminal amino acids of basic fibroblast growth factor. It has high fibroblast growth promoting, vasoendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing of, eg
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Muteins of basic fibroblast growth factor - lacking carboxy terminal amino acids, having growth promoting and angiogenic activities.
                                                                               09-AUG-1989

It has high fibroblast growth promoting, vasoendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing of, eg burns, wounds and postoperative tissues, as a drug for thrombosis or arteriosclerosis, or as a reagent to accelerate cell cultivation: Cys 70, Cys 88 and Ile 138 have been replaced by Ser
                                                                                                                                                                                                                                                                                                                                           Muteins of basic fibroblast growth factor - lacking carboxy terminal amino acids, having growth promoting and angiogenic activities.
                                                                                                                                           Sequence

                                                                                                                                                                                                       CC fusion partners that lack leader sequences. The nucleic acids, vectors, cc host cells and methods disclosed may be used to recombinantly produce CC large quantities of fusion proteins, in which the fusion partner lacks a cleader sequence, via fermentation culture according to standard CC recombinant DNA methodologies. The polypeptide of interest is cleaved CC away from the rest of the fusion protein by proteolytic digestion. A CC variety of polypeptides may be produced in this manner including enzymes, CC membrane receptors, mutant IGFBP-3s and fragments of them. Additionally, CC in the invention may be used in the screening of libraries of random CC interleukin-1-like (IL-1-like) polypeptide, the random peptides by assays for their biological function. When fused to an CC interleukin-1-like (IL-1-like) polypeptide, the random peptides accumulate in a protected cellular compartment in a soluble active form. CC cells (e.g. Escherichia coil), in a soluble, active and easily CC recoverable form at temperature at or close to the physiological optima CC that are otherwise unstable or insoluble may be expressed as fusions with the IL-1-like polypeptides or other leader deleted translocating CC peptides. Sequences y17992-996 represent five members of the II-1-like polypeptides or other leader deleted translocating CC peptides.

The mutein has high stability and is low in toxicity. It can be used as a healing accelerator for e.g. burns, wounds or postoperative tissues or as a therapeutic drug based on its angiogenic action for e.g. thrombosis or arteriosclerosis. It can also be used as a reagent for acceleration of cell cultivation. A mutein where at least one constituent cysteine is replaced by serine is preferred because the mutein is highly stable and intermolecular bridges and linkages are reduced or eliminated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human basic fibroblast growth factor; human bFGF mutein N14; growth promoting activity; growth stimulating activity; phage M13-PN14; capillary endothelial cells; angiogenic activity.

It can be used as a healing accelerator for e.g. burns, wounds or postoperative tissues or as a therapeutic drug based on its angiogenic action for e.g. thrombosis or arteriosclerosis. It can also be used as a reagent for acceleration of cell cultivation. A mutein where at least one constituent cysteine is replaced by serine is preferred because the mutein cysteine is replaced by serine is preferred because the mutein is highly stable and intermolecular bridges and linkages are reduced or eliminated.
rhbFGF mutein C129 (encoded by N90406) lacks 18 C-terminal amino acids of basic fibroblast growth factor. It has high fibroblast growth promoting, vascendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing cf, eg burns, wounds and postoperative tissues, as a drug for thrombosis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Using plasmid pTB856, E.coli MM294 was transformed, whereby the strain E.coli MM294/pTB856 was obtained, which harbors the plasmid pTB856 expressing the mutein represented here. The amino acid sequence from Lys130 to Ser147 has been deleted.

The mutein has high stability and is low in toxicity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mutein of basic fibroblast growth factor - having fibroblast growth promoting activity, growth stimulating activity of capillary endothelial cells and angiogenic activity
                                                                                      Disclosure;

                           of basic fibroblast growth factor. It has high fibroblast growth factor. It has high fibroblast growth factor. It has high fibroblast growth promoting, vascendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing of, eg burns, wounds and postoperative tissues, as a drug for thrombosis or arteriosclerosis, or as a reagent to accelerate cell cultivation. Cys 70 and Cys 88 have been replaced by Ser

It has high fibroblast growth promoting, vascendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing of, egunns, wounds and postoperative tissues, as a drug for thrombosis or

It has high fibroblast growth promotily vascendothelial cell growth promoting, and angiogenic activities, and high stability and low toxicity. It is used to accelerate healing of, burns, wounds and postoperative tissues, as a drug for thrombosis or arteriosclerosis, or as a reagent to accelerate cell cultivation.

                                                                                                                                                                                                                                                                                                                             rhbFGF mutein CS102 (encoded by N90401) lacks 46 C-terminal AAs of basic fibroblast growth factor. It has high fibroblast growth promoting, vasoendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing of, eg burns, wounds and postoperative tissues, as a drug for thrombosis or arteriosclerosis, or as a reagent to accelerate cell cultivation.

It has high fibroblast growth promoti vasoemoothelial cell growth promoting, and angiogenic activities, and high stability and low toxicity. It is used to accelerate healing of, burns, wounds and postoperative tissues, as a drug for thrombosis or arteriosclerosis, or as a reagent to accelerate cell cultivation.
                                                                                                                                                                                                                                26-JAN-1988;

                     rhbFGF mutein C114 (encoded by N90403) lacks 33 C-terminal amino acids of basic fibroblast growth factor. It has high fibroblast growth promoting, vasoendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing of, eg burns, wounds and postoperative tissues, as a drug for thrombosis or arteriosclerosis, or as a reagent to accelerate cell cultivation.

The antagonist modulates growth of epithelial (and related) cells and can be used diagnostically or therapeutically, eg to treat proliferative diseases of eyes and kidneys, some types of tumours and adrenal vascularisation. It is able to bind with heparin or with the FGF

                                   Using plasmid p7B796, E.coli MM294 was transformed, whereby the strain E.coli MM294/p7B796 was obtained, which (IFO 14701, FERM BP-1 harbors the plasmid p7B796 expressing the mutein represented here. The amino acid sequence Lys 87 to Ser 147 has been deleted. The mutein has high stability and is low in toxicity. It can be used as a healing accelerator for e.g. burns, wounds or postoperative tissues or as a therapeutic drug based on its angiogenic action for e.g. thrombosis or arteriosclerosis. It can all be used as a reagent for acceleration of cell cultivation. A mutein where at least one constituent cysteine is replaced by serine is preferred because the mutein is highly stable and intermolecular briand linkages are reduced or eliminated.
                                                                                                                                                                                                                                 Mutein of basic fibroblast growth factor having fibroblast growth promoting activ activity of capillary endothelial cells:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          residue sequence Pro-Asp-Gly-Arg which constitutes residues 36-39 of basic FGF; it is also antagonistic to acidic FGF. The antagonist modulates growth of epithelial (and related) cells and can be used diagnostically or therapeutically, eg to treat proliferative diseases of eyes and kidneys, some types of tumours and adrenal vascularisation. It is able to bind with heparin or with the FGF
                                                                                                                         Sequence
                                                                                                                                                                     The peptide bFGF(24-68)-NH2 (100mcg/ml) radioactive bFGF bound to the BHK cells affinity to bind heparin.
                                                                                                                                                                                                                                                                                                                               New fibroblast growth factor peptide(s) used to inhibit cell growth in culture or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      US5252718-A.

                                                                                                                                                                                                                                                                         Using plasmid p7B796, E.coli MM294 was transformed, whereby the strain E.coli MM294/p7B796 was obtained, which (IFO 14701, FERM BP-1661 harbors the plasmid p7B796 expressing the mutein represented here. The amino acid sequence Lys 87 to Ser 147 has been deleted. The mutein has high stability and is low in toxicity. The mutein has high stability and is low in toxicity. It can be used as a healing accelerator for e.g. burns, wounds or postoperative tissues or as a therapeutic drug based on its angiogenic action for e.g. thrombosis or arteriosclerosis. It can also be used as a reagent for acceleration of cell cultivation. A mutein where at least one constituent cysteine is replaced by serine is preferred because the mutein is highly stable and intermolecular bridge and linkers are recliced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human basic fibroblast growth factor; human bFGF mutein growth promoting activity; growth stimulating activity; capillary endothelial cells; anglogenic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mutein of basic fibroblast growth factor - having fibroblast growth promoting activity, growth stimulating activity of capillary endothelial cells and angiogenic activity
                                                                                                                                                                                                                        and linkages are reduced or eliminated. See also N81971-97.
